

LEVER-INK DUCT SYSTEMS

The progressive acting lever cartridges allow an optimal adjustability of the single segments, even minimal amounts of ink can be defined quick and precise.

Possible applications

The lever ink duct system suits perfect for all letterpress and offset-machines. For many machines standard solutions are available, but it is as well suitable for retrofitting. The system works independent from the machine type which makes it easy to find a solution for nearly every machine.

Ink duct

The ink ducts are available with precisely manufactured, segmented duct blades with widths from 100 to 1'400 mm. Depending on the application the segment width is being determined. Segment widths with 20.5 mm are standard, for special applications widths from 16 mm are possible. The high accuracy of the lever cartridges allows a reproducible setting of the desired ink flow. Removable lateral blocks simplify the cleaning of the ink duct.

Mounting Options

Quick Release: The quick-release mounting system allows a very short cleaning time and simplifies the handling for maintenance enormously.

Clamp-on: The classic mounting option for smaller and lighter ink duct systems. The systems will be simply assembled with two screws.

Swiveling: The swivel-down mounting option is needed with bigger and heavier ink duct systems or electronic ink duct systems. It ensures the easiest and quickest way for cleaning and maintenance.

- + quick, reproducible settings
- + shorter make ready times
- + less waste material
- + easy cleaning
- + simple adjustment + clear scale
- + minimal blade wear

Our patented ink control system ensures a precise ink flow.

These systems are a perfect solution to retrofit existing machines.
